Installation Options

Please view this article in full-screen mode, or download the attached PDF

- **Mac Users: See Option 1 and Option 3**
- **Linux Users: See Option 1**
- **Windows Users: See Option 2 and Option 3**

Option 1 - Setting Bash As Your Default Shell

Suitable for: Linux, Mac

This option is your first option if you are running a system that uses Linux or Mac operating systems.

To check which shell you are running you can run the below command:

```
echo $SHELL
```

If this does not give you back bash (e.g. `/bin/bash` or `/usr/bin/bash`) then you can run the below command to set your default shell to bash:

```
chsh -s /bin/bash
```

Option 2 - Windows Subsystem for Linux (WSL)

Suitable for: Windows 10 Users

If you are running Windows 10, then your best option is to setup Windows Subsystem for Linux.

You can follow the tutorial video provided in this section for steps on how to set this up.

Option 3 - Installing Ubuntu in a Virtual Box

Suitable for: Windows, Mac

If none of the above options are working for you, then you can install virtual box on windows, or mac and setup an Ubuntu virtual machine to work with bash.

You can follow the tutorial video provided in this section for steps on how to set this up.
